Chapter 1: Introduction

OpenVPN Access Server is a full featured SSL VPN software solution that integrates OpenVPN server capabilities, enterprise management capabilities, simplified OpenVPN Connect UI, and OpenVPN Client software packages that accommodate Windows, MAC, Linux, Android, and iOS environments. OpenVPN Access Server supports a wide range of configurations, including secure and granular remote access to internal network and/ or private cloud network resources and applications with fine-grained access control.

An OpenVPN Access Server deployment consists of one server, many clients and many users, as depicted in Figure 1.1. Each client machine in this topology uses the public IP network (the Internet) to communicate with the OpenVPN Access Server and thereby gains VPN-protected access to the private IP Network connected (if present).

Figure 1.1: The OpenVPN Access server topology

If adequate licenses are not available in the OpenVPN Access server, then the users will not be able to connect to the Private IP Network. Also sometimes, a particular user may hog the bandwidth of the network by transmitting/ receiving large chunks of data through the server. It is therefore

imperative that the OpenVPN Access server is monitored periodically for assessing the license utilization and the user details. This can be achieved using eG Enterprise.

Chapter 2: How to Monitor OpenVPN Access server Using eG Enterprise?

eG Enterprise monitors the OpenVPN Access server in both agent-based and agentless manners. To monitor the OpenVPN Access server in the agentless manner, you should install a single eG agent on any remote Windows host in the environment. To enable the eG agent to communicate with the OpenVPN Access server, a set of pre-requisites should be fulfilled. These requirements have been discussed in the below section.

2.1 Pre-requisites for monitoring the OpenVPN Access server

To monitor the OpenVPN Access server, you should provide certain user privileges that are required to execute the commands for monitoring the OpenVPN Access server. To provide the user with the necessary privileges, do the following:

1. Login to the OpenVPN Access server host through **putty.exe**.

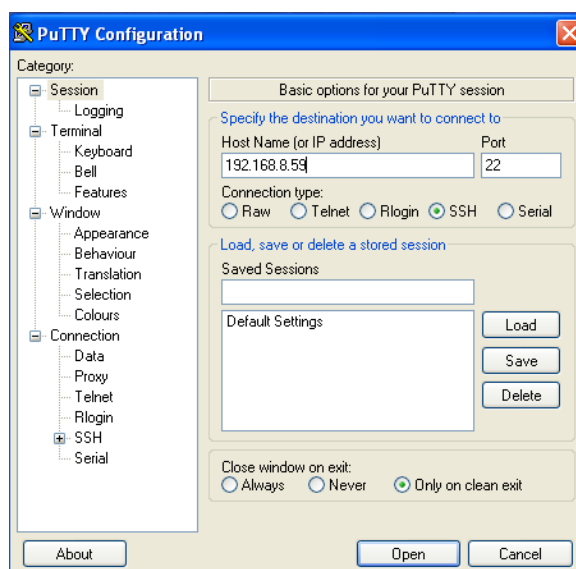

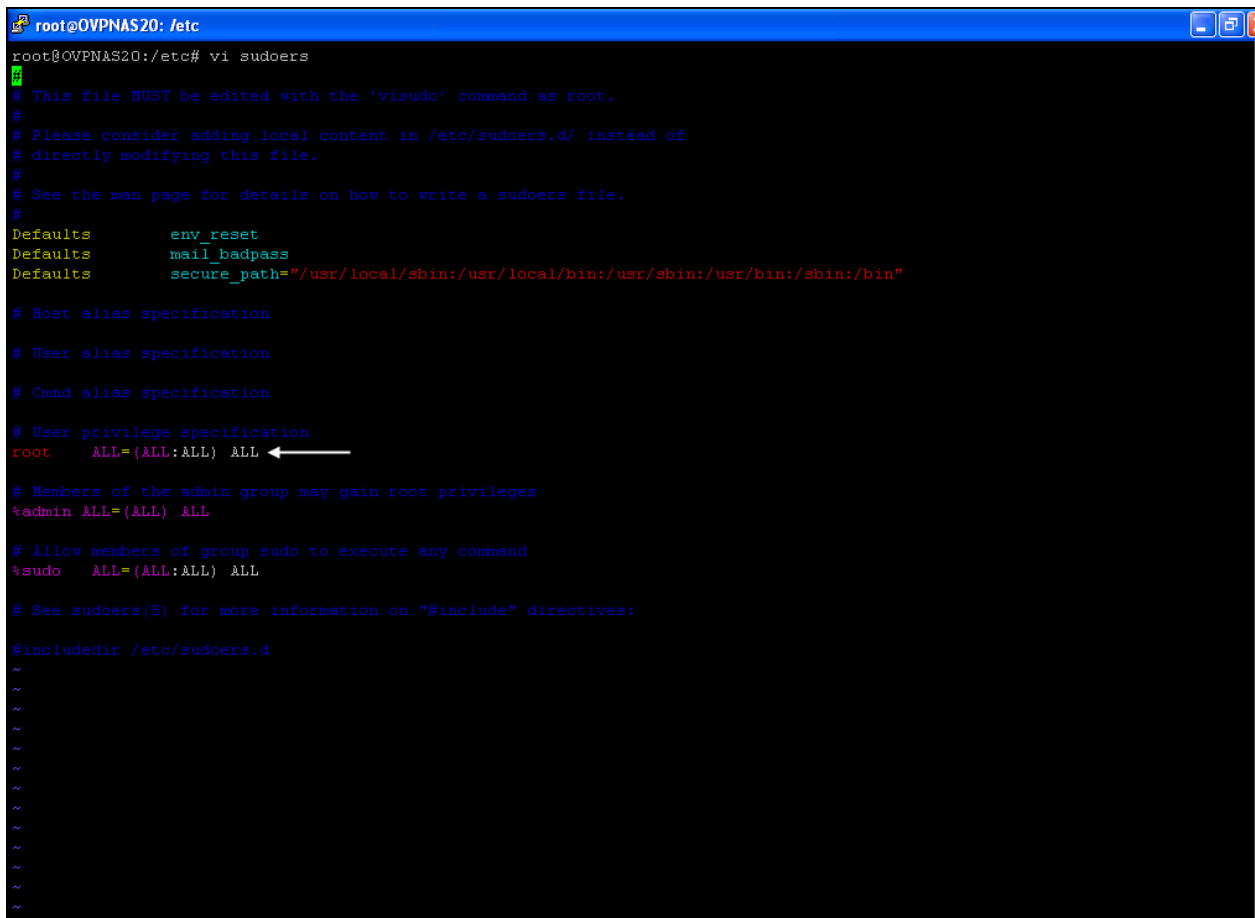

Figure 2.1: Login to Putty

2. Upon logging in, navigate to the **/etc/sudoers** file of the OpenVPN Access server. By default, certain user privileges are required to execute the commands for monitoring the OpenVPN Access server. The default user privileges to the server will be "ALL" (see Figure 2.2).

```
root@OVPNAS20: /etc
root@OVPNAS20:/etc# vi sudoers
# This file MUST be edited with the 'visudo' command as root.
#
# Please consider adding local content in /etc/sudoers.d/ instead of
# directly modifying this file.
#
# See the man page for details on how to write a sudoers file.
#
Defaults        env_reset
Defaults        mail_badpass
Defaults        secure_path="/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin"

# Host alias specification

# User alias specification

# Cmnd alias specification

# User privilege specification
root    ALL=(ALL:ALL) ALL ←
# Members of the admin group may gain root privileges
%admin    ALL=(ALL) ALL

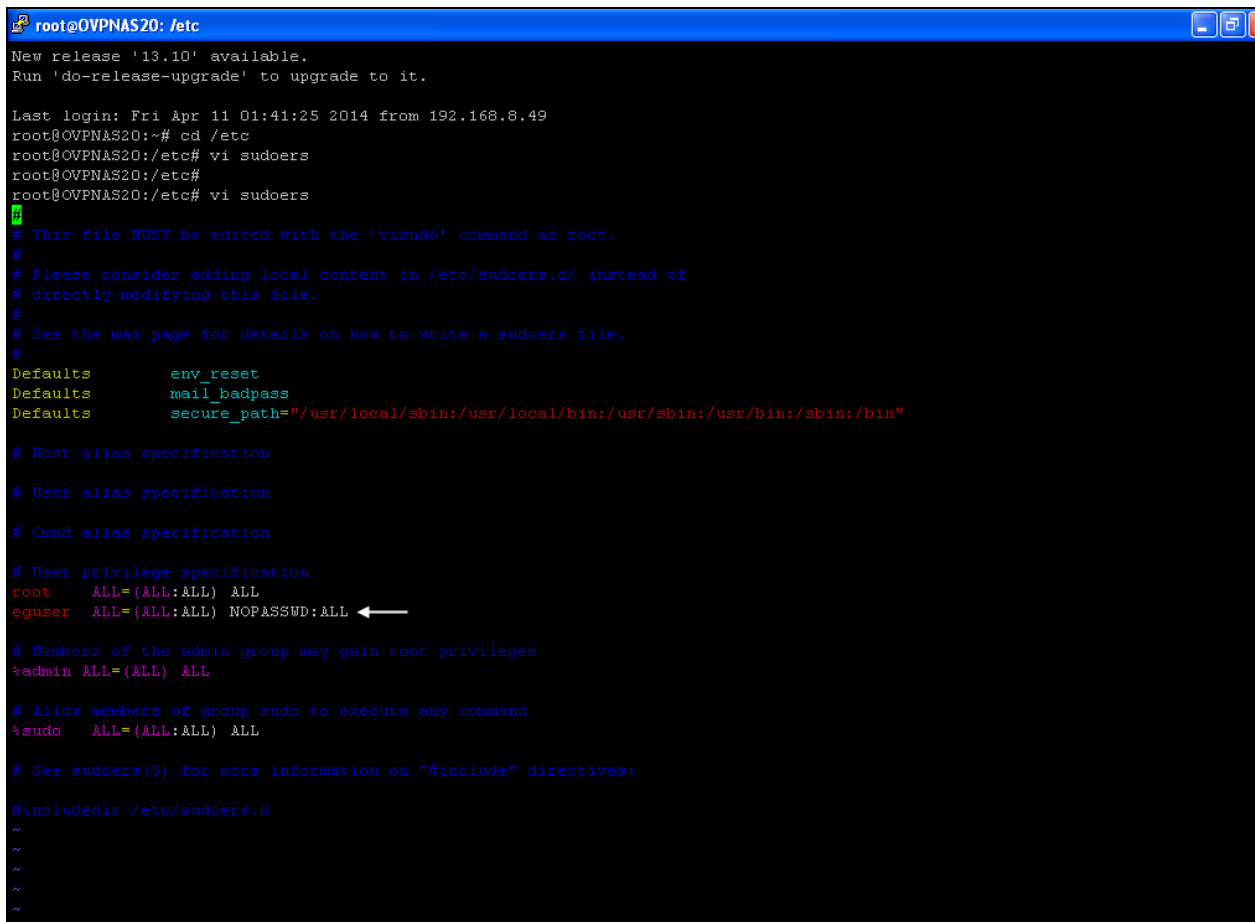

# Allow members of group sudo to execute any command
%sudo    ALL=(ALL:ALL) ALL

# See sudoers(5) for more information on "#include" directives:

#include_dir /etc/sudoers.d
~
~
~
~
~
~
~
~
~
~
~
```

Figure 2.2: The default user privileges

3. If the target environment does not allow the eG Enterprise suite to use the default user for monitoring, then you need to create a new user with the default user privileges. You can do so by including the new user below the default user available under the **User privilege specification** section (see Figure 2.2). If you wish to create a new user for e.g., **eguser** with the default user privileges, then do so as shown in Figure 2.3.

```

root@OVPNAS20: /etc
New release '13.10' available.
Run 'do-release-upgrade' to upgrade to it.

Last login: Fri Apr 11 01:41:25 2014 from 192.168.8.49
root@OVPNAS20:~# cd /etc
root@OVPNAS20:/etc# vi sudoers
root@OVPNAS20:/etc#
root@OVPNAS20:/etc# vi sudoers
# This file MUST be edited with the 'visudo' command as root.
#
# Please consider adding local content in /etc/sudoers.d/ instead of
# directly modifying this file.
# See the man page for details on how to write a sudoers file.
#
Defaults    env_reset
Defaults    mail_badpass
Defaults    secure_path="/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin"

# Host alias specification

# User alias specification

# Cmnd alias specification

# User privilege specification
root    ALL=(ALL:ALL) ALL
eguser  ALL=(ALL:ALL) NOPASSWD:ALL ←
# Members of the admin group may gain root privileges
%admin  ALL=(ALL) ALL

# Allow members of group sudo to execute any command
%sudo  ALL=(ALL:ALL) ALL

# See sudoers(5) for more information on "#include" directives:

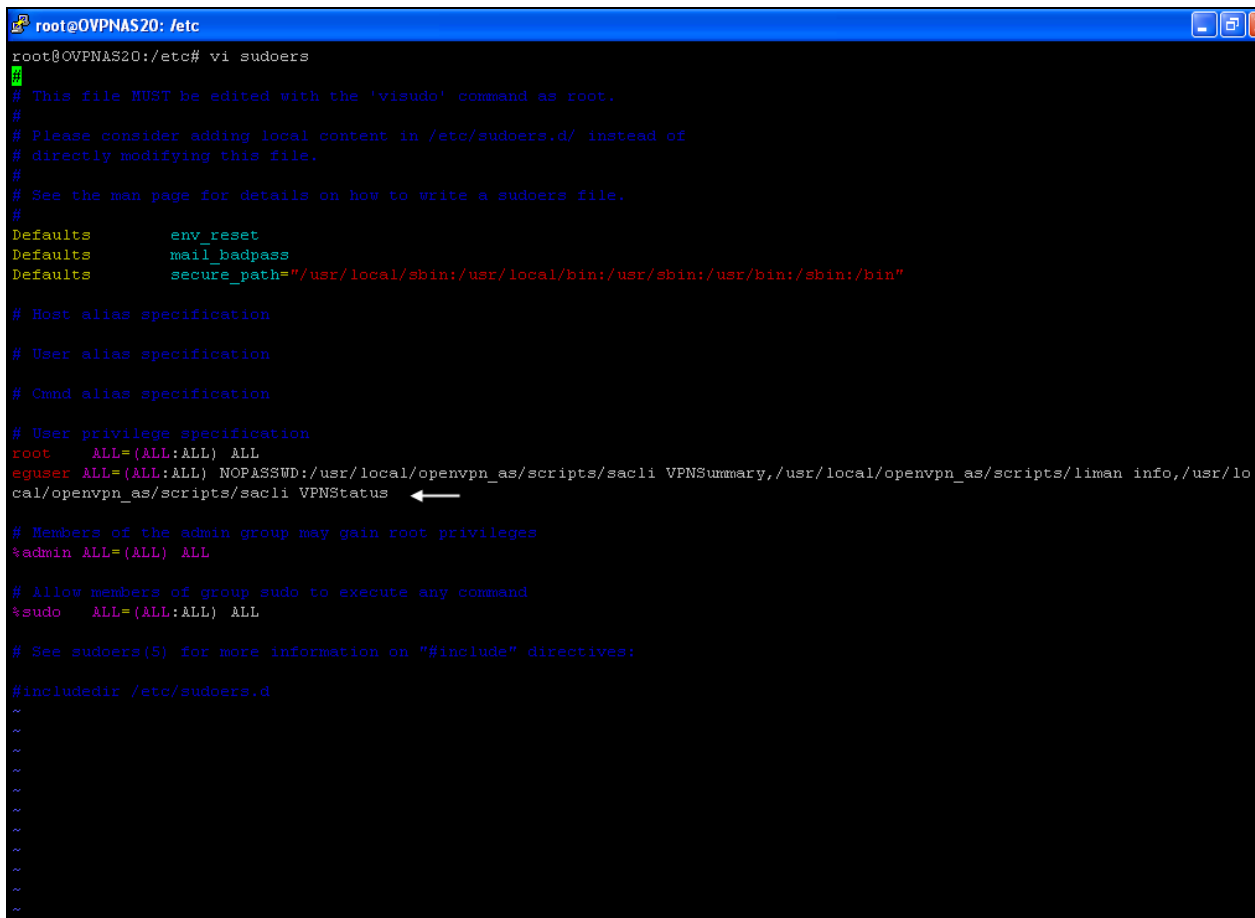

#include_dir /etc/sudoers.d
~
~
~
~
~

```

Figure 2.3: Creating a new user with the default user privileges

4. By providing the default user privileges, **eguser** acquires the entire monitoring rights of the OpenVPN Access server.
5. If the administrator of the target environment does not wish to provide the default user privileges to the **eguser**, then you can limit the user privileges to monitor only the tests that need to be executed by the eG Enterprise suite. To do so, specify the following command (see Figure 2.4).

```
eguser          ALL=      (ALL:ALL)          NOPASSWD:/usr/local/openvpn_  as/scripts/saccli
VPNSummary,/usr/local/openvpn_as/scripts/saccli VPNStatus
```

```

root@OVPNAS20: /etc
root@OVPNAS20:/etc# vi sudoers
# This file MUST be edited with the 'visudo' command as root.
#
# Please consider adding local content in /etc/sudoers.d/ instead of
# directly modifying this file.
#
# See the man page for details on how to write a sudoers file.
#
Defaults        env_reset
Defaults        mail_badpass
Defaults        secure_path="/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin"

# Host alias specification

# User alias specification

# Cmnd alias specification

# User privilege specification
root    ALL=(ALL:ALL) ALL
eguser  ALL=(ALL:ALL) NOPASSWD:/usr/local/openvpn_as/scripts/sacl VPNSummary,/usr/local/openvpn_as/scripts/liman info,/usr/local/openvpn_as/scripts/sacl VPNStatus
# Members of the admin group may gain root privileges
%admin   ALL=(ALL) ALL

# Allow members of group sudo to execute any command
%sudo   ALL=(ALL:ALL) ALL

# See sudoers(5) for more information on "#include" directives:

#include_dir /etc/sudoers.d
~
~
~
~
~
~
~
~
~
~

```

Figure 2.4: Creating a new user with limited user privileges required for monitoring the server

6. Once the necessary user privileges are provided, the target OpenVPN Access server is ready for monitoring by the eG Enterprise suite.

2.2 Managing the OpenVPN Access Server

The eG Enterprise cannot automatically discover the OpenVPN Access Server. This implies that you need to manually add the component for monitoring. Remember that the eG Enterprise automatically manages the components that are added manually. To manage a OpenVPN Access Server component, do the following:

1. Log into the eG administrative interface.
2. Follow the Components -> Add/Modify menu sequence in the **Infrastructure** tile of the **Admin** menu.
3. In the **COMPONENT** page that appears next, select OpenVPN Access Server as the

Component type. Then, click the **Add New Component** button. This will invoke 2.2.

The screenshot shows a web form titled 'COMPONENT' with a 'BACK' button in the top right. A yellow banner below the title contains the text: 'This page enables the administrator to provide the details of a new component'. The form has two dropdown menus at the top: 'Category' set to 'All' and 'Component type' set to 'OpenVPN Access Server'. Below these are two sections: 'Component information' and 'Monitoring approach'. In the 'Component information' section, 'Host IP/Name' is '192.168.10.1' and 'Nick name' is 'vpnaccess'. In the 'Monitoring approach' section, 'Agentless' is unchecked, 'Internal agent assignment' has 'Auto' selected (indicated by a blue circle), and 'Manual' is unselected. Under 'External agents', the IP '192.168.8.202' is listed in a blue-highlighted row. An 'Add' button is at the bottom center.

Figure 2.5: Adding an OpenVPN Access server

4. Specify the **Host IP/Name** and **Nick name** for the OpenVPN Access Server (see Figure 2.5). Then, click on the **Add** button to register the changes.
5. Next, try to sign out of the eG administrative interface. Now, you will be prompted to configure the **Processes** test. To know how to configure this test, refer to *Monitoring Unix and Windows Servers* document.
6. Finally, signout of the eG administrative interface.

Chapter 3: Monitoring the OpenVPN Access Server

eG Enterprise has designed a specialized OpenVPN Access server monitoring model (see Figure 3.1), which periodically monitors the server and reports the administrators with effective pointers to the utilization of the licenses, and the users who are currently connected to the server and their data transmission. The following queries too can be easily clarified by monitoring the server:

- How many users are actually connected to the OpenVPN Access server?
- Are there adequate licenses available for users? If so, How many are available totally and how many are left for users in future?
- How long has a user been active over the network through the OpenVPN Access server? Which user is hogging the bandwidth of the network when data is transmitted/received?

Figure 3.1: The layer model of the OpenVPN Access server

Since the tests pertaining to the **Operating System**, **Network**, **TCP** and **Application Processes** layer of the **OpenVPN Access Server** model have been dealt with in the *Monitoring Unix and Windows Servers* document, Section 3.1 focuses on the tests associated with the **OpenVPN Service** layer alone.

3.1 The OpenVPN Service Layer

This layer tracks the number of users who are concurrently connected to the server, the license utilization of the server, the time duration for which a user was active and the amount of data that is transmitted/received by the user. Figure 3.2 lists the tests that are currently mapped to the OpenVPN Service layer.

Figure 3.2: The tests mapped to the OpenVPN Service layer

3.1.1 OpenVPN Users Test

Administrators may constantly wish to be alerted on the number of users who are currently connected to the OpenVPN Access server so that they can monitor the user login patterns at any given time. The OpenVPN Users test exactly does the same! This test continuously tracks the number of users who are currently connected to the server so that the administrator can rapidly detect a sudden surge in the number of users connecting to the server.

Target of the test : An OpenVPN Access Server

Agent deploying the test : An internal/remote agent

Outputs of the test : One set of results for the OpenVPN Access server that is to be monitored.

Configurable parameters for the test

Parameter	Description
Test period	How often should the test be executed.
Host	The host for which the test is to be configured.
Port	The port number at which the specified Host listens to. By default, this is <i>NULL</i> .

Measurements made by the test

Measurement	Description	Measurement Unit	Interpretation
Active users	Indicates the number of users who are currently connected to the server.	Number	An abnormally high value for this measure indicates a malicious attack on the server which is a cause of concern.

3.1.2 OpenVPN User License Test

A license is always required for the OpenVPN Access server installation. It can either be a free license or a purchased license. Once the server is installed, each license carries a maximum number of concurrent users who will be able to connect to the server. Depending on the number of users connecting to the OpenVPN Access servers, multiple licenses can be obtained. In case of purchased licenses, the maximum number of concurrent user count is additive and in the case of free licenses, the user count is not additive. If multiple free licenses are activated, then the user count will be the maximum of the individual user counts for each free license. Administrators may constantly need to track the utilization and availability of the licenses so that end user experience in connecting to the OpenVPN Access server would not be affected at all! This is where the **OpenVPN User License** test helps! This test monitors how well the licenses are managed by the OpenVPN Access server. This way, the administrators can figure out from a single glance the total number of licenses, the licenses that are already exhausted and the licenses that are available for future use.

Target of the test : An OpenVPN Access Server

Agent deploying the test : An internal/remote agent

Outputs of the test : One set of results for the OpenVPN Access server that is to be monitored.

Configurable parameters for the test

Parameter	Description
Test period	How often should the test be executed.
Host	The host for which the test is to be configured.
Port	The port number at which the specified Host listens to. By default, this is <i>NULL</i> .

Measurements made by the test

Measurement	Description	Measurement Unit	Interpretation
Total licenses	Indicates the total number of licenses that are available for this server.	Number	The value of this measure is the sum of the <i>Licenses used</i> and the <i>Available licenses</i> measure.
Licenses used	Indicates the number of licenses that are currently in use.	Number	If the <i>Licenses used</i> measure is equal to the <i>Total licenses</i> measure, then the <i>Available licenses</i> measure

Measurement	Description	Measurement Unit	Interpretation
			would be 0 which clearly indicates that all the licenses are already exhausted. This would terribly affect the user experience with the OpenVPN Access server. Therefore, administrators may want to be alerted when the <i>Licenses used</i> measure reaches close to the <i>Total licenses</i> , so that they may marginally increase the number of licenses.
Available licenses	Indicates the number of licenses that are currently available for use.	Number	

3.1.3 OpenVPN User Details Test

In secure environments where users connect to the target IP network through the OpenVPN Access server, administrators may want to figure out the duration of the time a user has spent over the network accessing the network resources. Similarly, administrators may also want to monitor the data transmission for each user through the server so that they can figure out the user who has hogged the bandwidth limit of the network while transmitting/receiving the maximum amount of data. This is where the **OpenVPN User Details** test helps! For each user accessing the OpenVPN Access server, this test monitors the data transmitted and received by the user while accessing the resources of the network through the OpenVPN Access server and the time duration for which the user was active on the network. This way, administrators can figure out the user who has been very active over a period of time!

Target of the test : An OpenVPN Access Server

Agent deploying the test : An internal/remote agent

Outputs of the test : One set of results for each user of the OpenVPN Access server that is to be monitored.

Configurable parameters for the test

Parameter	Description
Test period	How often should the test be executed.
Host	The host for which the test is to be configured.
Port	The port number at which the specified Host listens to. By default, this is <i>NULL</i> .

Measurements made by the test

Measurement	Description	Measurement Unit	Interpretation
Data transmitted	Indicates the amount of data transmitted by this user.	KB	Comparing the value of these measures across the users helps you in identifying the VPN user who is hogging the bandwidth of the network by transmitting/receiving the maximum amount of data.
Data received	Indicates the amount of data received by this user.	KB	
Active session duration	Indicates the time duration for which this user was active.	Mins	Comparing the value of this measure across the users reveals the most active user on the server.

About eG Innovations

eG Innovations provides intelligent performance management solutions that automate and dramatically accelerate the discovery, diagnosis, and resolution of IT performance issues in on-premises, cloud and hybrid environments. Where traditional monitoring tools often fail to provide insight into the performance drivers of business services and user experience, eG Innovations provides total performance visibility across every layer and every tier of the IT infrastructure that supports the business service chain. From desktops to applications, from servers to network and storage, from virtualization to cloud, eG Innovations helps companies proactively discover, instantly diagnose, and rapidly resolve even the most challenging performance and user experience issues.

eG Innovations is dedicated to helping businesses across the globe transform IT service delivery into a competitive advantage and a center for productivity, growth and profit. Many of the world's largest businesses use eG Enterprise to enhance IT service performance, increase operational efficiency, ensure IT effectiveness and deliver on the ROI promise of transformational IT investments across physical, virtual and cloud environments.
